

# Mobile Application Development with Flutter

Lecture 14: Text Widget in Flutter

# Text Widget

- A fundamental stateless widget used to display a string of text with a single style
- It offers extensive customization options for appearance and behavior
- It can also be used with RichText widget to apply multiple styles within the same paragraph

# Syntax

```
Text(  
  "Hello Flutter",  
  style: TextStyle(),  
)
```

- First parameter → String (required)
- Other parameters → Named optional properties

# Key Properties and Styling

- fontSize
- color
- fontWeight
- fontStyle
- letterSpacing
- wordSpacing
- Height
- backgroundColor
- Decoration
- decorationColor
- decorationStyle
- textAlign
- maxLines
- overflow
- softWrap
- textDirection

# Best Practice (Professional Tip)

- Instead of styling text everywhere manually, use theme
- If you have **50 Text widgets**, you must repeat this style everywhere.

```
Text(  
  "Hello",  
  style: Theme.of(context).textTheme.titleLarge,  
)
```

# Where Text Theme Is Defined

```
MaterialApp(  
  theme: ThemeData(  
    textTheme: TextTheme(  
      headlineLarge: TextStyle(  
        fontSize: 32,  
        fontWeight: FontWeight.bold,  
      ),  
      titleLarge: TextStyle(  
        fontSize: 22,  
        fontWeight: FontWeight.w600,  
      ),  
      bodyMedium: TextStyle(  
        fontSize: 16,  
      ),  
    ),  
  ),  
)
```

# Overriding Theme Locally

- Sometimes we want to modify a theme style slightly
- Example:

```
Text(  
  "Flutter",  
  style: Theme.of(context)  
    .textTheme  
    .titleLarge  
    ?.copyWith(color: Colors.red),  
)
```

- This keeps everything same but changes color

# Professional Project Structure

- Usually themes are stored in a separate file:

```
lib/  
├── main.dart  
├── theme/  
│   └── app_theme.dart
```

# Professional Project Structure

- Example:

```
class AppTheme {  
    static ThemeData lightTheme = ThemeData(  
        textTheme: const TextTheme(  
            headlineLarge: TextStyle(fontSize: 30),  
            bodyMedium: TextStyle(fontSize: 16),  
        ),  
    );  
}
```

- Then use:

```
MaterialApp(  
    theme: AppTheme.lightTheme,  
)
```
