

Mobile Application Development with Flutter

Lecture 34. Splash Screen in Flutter

What is Splash Screen?

- A **splash screen** is the first screen that appears when an app opens
- It usually stays visible for a short time and then automatically moves to the next screen
- It commonly shows:
 - App logo
 - App name
 - Tagline
 - Brand colors
 - Loading feel
- In simple words, it is the **welcome screen of an app**.

Advantages of Splash Screen

- Improve app presentation
- Gives branding opportunity
- Makes app startup feel smooth
- Can hide loading delay
- Useful for routing decisions
- Helps create premium user experience

Avoid These Mistakes

- Keeping splash screen too long
- Adding unnecessary delays
- Too much text on splash screen
- Very heavy animations
- Using splash screen when app is already fast and nothing needs loading
- A splash screen should usually stay for **2 to 4 seconds** only, unless there is a real loading reason

Types of Splash Screens

1. Simple Splash Screen

- Background color
- Icon/logo
- App name
- Best for beginners and small apps

2. professional Splash Screen

- Logo, app title, subtitle
- Animation or progress indicator
- Consistent theme
- Better alignment with app UI

Types of Splash Screens

3. Login-Based Splash Screen

- A splash screen that checks app state and then decides next screen

- Examples:

- Login check
- Onboarding check
- Internet check
- Role-based navigation

Two Meanings of Splash Screen in Flutter

A) Native Splash Screen

- Appears immediately after app launches, before Flutter UI loads
- This is handled using:
 - Android native files
 - iOS native files
 - or package like flutter_native_splash

B) Flutter Splash Screen

- This is a normal Flutter screen made using widgets
- This appears after Flutter starts

How Does Auto Close Work?

- To close splash screen automatically after a few seconds, we usually use:
 - `Future.delayed()`
 - Or
 - `Timer`
- After delay:
 - Navigate to next screen using `Navigator.pushReplacement()`
- `pushReplacement()` is better because it removes splash screen from navigation stack, so user cannot go back to it by pressing back button
