Lecture 39. Wrap Widget in Flutter

What is Wrap Widget?

- Wrap is a layout widget that displays its children in a horizontal or vertical sequence
- It automatically moves children to the next line when there is no space
- 👉 **Wrap = Smart Row / Smart Column**
- This is useful for dynamic layouts like tag clouds or button groups and helps avoid the overflow errors

Tag Clouds Screenshot

? If GridView exists, why Wrap?

- **GridView**

- Fixed structure (rows & columns)
- Equal-sized items
- Scrollable
- Best for:
 - Products
 - Images
 - Cards

- **Wrap**

- Flexible layout
- Different sizes allowed
- Non-scroll (by default)
- Best for:
 - Chips
 - Tags
 - Buttons

Key Properties

- **direction:**
 - Sets the main axis. `Axis.horizontal` (default) makes it behave like a row that wraps; `Axis.vertical` makes it behave like a column that wraps
- **spacing:**
 - The amount of empty space between children within a single run (main axis)
- **runSpacing:**
 - The amount of space between the runs themselves (cross axis)
- **alignment:**
 - Controls how children are aligned within each run
- **runAlignment:**
 - Controls how the runs themselves are aligned relative to each other
