

Mobile Application Development with Flutter

Lecture 43. Alert Dialog in Flutter

What is AlertDialog?

- AlertDialog is used to communicate important information or get confirmation from the user

Real-World Use Cases

- Delete confirmation
- Logout confirmation
- Error messages
- Success messages
- Permission requests

How AlertDialog Works?

- To display an alert, we must use the showDialog() function
- This function pushes the dialog onto the navigator stack above the current app content
- showDialog
 - Requires a context and a builder function that returns the AlertDialog widget
- Dismissal
 - Use Navigator.pop(context) within button callbacks to close the dialog

Primary Properties

- The AlertDialog class typically includes three main sections:
- title
 - A widget (usually Text) displayed at the top in a large font
- content
 - The body of the dialog, often providing detailed information or a description
- actions
 - A list of widgets, typically TextButton or ElevatedButton, displayed at the bottom

Barrier Behavior (Very Important)

By default:

- User can tap outside → dialog closes

Disable Outside Tap

```
showDialog(  
  context: context,  
  barrierDismissible: false,  
  builder: (context) => AlertDialog(...),  
);
```
